PERMISSION TO USE

In presenting this project in partial fulfillment of the requirements for a postgraduate degree from the University Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this thesis in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor, in his absence, by the dean of the Faculty of Information Technology. It is understood that any copying or publication or use of this project or parts thereof for financial gain should not be allowed without my written permission. It is also understood that due recognition shall be given to me and to University Utara Malaysia for any scholarly use which may be made of any material from my project.

Requests for permission to copy or to make use of materials in this project, in whole or in part should be addressed to:

Dean of Research & Postgraduate Studies

College of Arts & Sciences

Universiti Utara Malaysia

ABSTRACT

Democracy and elections have more than 2,500 years of tradition. Technology has always influenced the form of elections and the complexity of ways. Performing a good security analysis in the design of the system is a necessary step in order to ensure a reasonable level of protection. In this paper, we decided to use the fingerprint on the electronic voting system to increase the speed and accuracy in the proceedings of the electoral process, with the construction of a high-protection system based on fingerprint voters to give most reliable results, and tries to automation of the electoral system in Iraq, and gains the advantage of an e-voting system.

ACKNOWLEDGMENT

بسم الله الرحمن الرحيم

I humbly thank Allah Almighty, the Merciful and Beneficent, who gave me health, thoughts and co-operative people to me achieve this goal.

I wish to dedicate this work to Holy Prophet Muhammad (peace be upon him) and his companions who laid foundation of modern cultural and physical revolution.

Also I wish to dedicate this work to my father, my Mother my Brothers, and my sisters for their never ending moral support and prayers which always acted as a catalyst in my academic life.

I am heartily thankful to my supervisor, ASSOC. PROF. HATIM MOHAMAD TAHIR for his assistance, guidance and support during the project. Furthermore, my sincere thanks to Mr. ALI YUSNY for giving me idea and comments in making this project right on track.

To my Mother, for her presence, graciousness, and love which motivated me to finish my project, she has always followed me very closely, even though when she was thousands of miles away.

Finally, I offer my regards and blessings to all of those who supported me in any respect during the completion of the research they are (Hayder Khodair, Gza, Moayad Hamed, Aymen Shawkat, Khaled Hussain, Ahmad R., Nassir J., Aqeel S., Anwar A. and Hayder H.) And those who could not mentioned thanks for their support to me and to all my friends in Iraq and my friends in Malaysia.

CHAPTER ONE

INTRODUCTION

1.1 INTRODUCTION

E-voting (electronic voting) is a relatively new concept, based on your application, which aims to reduce errors and increase the comfort and integrity of the electoral process. The use of electronic voting systems led to a split, as some countries use these systems, and others do not (Abu, Knight, & Refai (2010)).

E-voting is an election method in which the votes are cast or collected by electronic means. The computer system in which the main component is a software component that displays the electronic voting procedure, called the electronic voting system. Direct recording electronic machine is a special case of this system, because it implements all phases of the voting process, from registration and ballot counting (Ondrisek 2009).

E-voting also increasingly gains interest in e-democracy and e-government movements. Not only the security and availability of electronic voting systems are of paramount importance, and scalability is of great interest. Especially the fact that in political elections the system has to scale nationwide, thus having several millions of users (Rossler, Leitold, & Posch 2005).
